

# **The prosody of the prefix *ge-* in (early) West Germanic**

**Tina Bögel, Chiara Riegger & George Walkden**

Forum for Germanic Language Studies 2024, 12.04.2024

---

## Overview

**Research question:** Are prosodic words determined by syntactic structure or by rhythmic principles?

- The phrasing of prosodic words is determined by
  - morphological structure
  - rhythmic principles
- Evidence from the *ge*-prefix:
  - Corpus studies (Old Saxon, Old English & Old High German)
  - Production experiment in Modern German

# Prosody-Syntax Interface

- Starting point: prosodic constituent structure reflects syntactic constituent structure to a large extent (a.o., Selkirk 1986, Nespor and Vogel 1986, Selkirk 2011)
- atch theory (Selkirk 2011) proposes that
  - each syntactic clause corresponds to an intonational phrase ( $\iota$ )
  - each syntactic phrase corresponds to a phonological phrase ( $\varphi$ )
  - each syntactic word corresponds to a prosodic word ( $\omega$ )
- But: evidence of extensive non-isomorphism between syntactic and prosodic structure (a.o., Jun (1993), Gee and Grosjean (1983), Cheng (1973), Ferreira (1993))
- Non-isomorphism especially with function words (a.o., Truckenbrodt (1999), Selkirk (1995))
- Assumption of an independent prosodic structure with several influencing factors – among them: syntactic structure (e.g., Shattuck-Hufnagel and Turk (1996), Beckmann (1996))

## Rhythmic organisation of prosodic structure

Prosodic phrasing in Germanic languages:

- 'leftwards' oriented encliticisation of function words regardless of syntactic constituency
- supports independent prosodic structure, which can be influenced by, but is often independent of syntactic structure
- **trochaic foot** as the fundamental driving force, also across word boundaries (Abercrombie (1964), see also Cutler (1996))
- Is prosodic structure determined by rhythmic principles? (a.o., Sweet (1885), Sievers (1901), Lahiri and Plank (2010))

# Prosodic words

Elusive definition – some assumptions:

- a) Lexical words form prosodic words, functional words don't - except if they are placed at the initial or final position of an intonational phrase, are in focus, or are 2+syllabic (see discussion in Shattuck-Hufnagel and Turk (1996), Bögel (2021))
- b) Possible acoustic indication: increased closure duration of stops in word-initial position (Cooper 1991)
- c) Prosodic words can be larger or smaller than lexical words
- d) Based on foot structure: "minimally a stressed foot [...] and maximally a single lexical word combined with any associated unstressed function words" (Wheeldon 2000)

## The rhythmic phrasing of prosodic words

**Unclear:** Whether morphologically complete words can be prosodically ‘split’.

- Indicated in literature:

**Sweet (1904)**

**Eisenberg (2006)**

**Phonological**

(I'm a) (freid)

(Frisch ge) (wagt ist)

(halb ge) (wonnen)

**Morphological**

[I'm] [afraid]

[Frisch] [gewagt] [ist]

[halb] [gewonnen]

## The rhythmic phrasing of prosodic words

morphosyntactic phrasing:	´ ] [ x ´ x]
prosodic phrasing:	´ x )( ´ x)

Some evidence for rhythmic phrasing:

- **Diachronic data:** Old Saxon, Old English, and Old High German orthography
- **Synchronic data:** German experimental data

## The *ge-* prefix in early West Germanic

- Common across several word categories
- the common origin, Proto-Germanic *\*ga/gi*, is assumed to have marked perfectivity and resultativity in preverbal position a.o. (Streitberg 1891, van Kemenade & Los 2003)
- Pronounced [jə] in OS and OE and [gə] in OHG
- Vanished in Modern English (except for remnants in words like *alike*, *aware*) but remained in Modern German and Low German

## Orthography in early West Germanic

Word division is less strict:

- Short words often run together
- Compounds are often divided into two parts
- Occasionally, the *ge-* prefix can be found attaching to previous words detaching from the following stem or both

Example from Parker/Winchester Chronicle: (Corp. Chris. MS 173, facsimile by Flower and Smith 1941)

*... and him with gefuhton and hie gefliemdon ...*

*‘... and fought with them and put them to flight...’*

## Are these prosodic reflexes?

Hardly any research on this topic - mentionings in, e.g., Nübling (1992), Frey (1988), Fleischer (2009), and Parkes (1992)

### Historical reasoning:

- Greek and Roman tradition after the first century was the *scriptio continua*
- Written word was a record of the spoken word, texts were read out loud (*elocutio*)

“An early medieval text was always either a program for or a record of the spoken word”  
(Treitler 1984: 141)

Preparation for a declamation: finding the right spot to take a breath, and when to pause to indicate a sense unit

⇒ Not far-fetched to assume leftovers of these traditions in early West Germanic scripts

## Corpus Study I: Old Saxon

**Text used:** The Heliand  
(Cotton Caligula A. VII)

- Epic about the life of Christ
- Manuscript written in Winchester England, presumably by a Saxon scribe
- Composed in the 10th century

**Method:**

- Automatic search for *ge*-prefixed verbs and their preceding neighbors in transcription (modern word division)
- Manual search in the manuscript for orthographic varieties

## Results

Four possible orthographic distributions of *ge-* sorted by previous word category (lexical or function word)

Division	Total	Prec. function word	Prec. lexical word
<b>word <i>ge</i>-verb:</b>	93 %	23.7 %	76.3 %
<b>word-<i>ge</i> verb:</b>	3.2 %	85.3 %	14.7 %
<b>word-<i>ge</i>- verb:</b>	2.6 %	66.6 %	33.3 %
<b>word <i>ge</i> verb:</b>	1.2 %	61.5 %	38.5 %

- If *ge-* deviates from the expected pattern, then preferably with a preceding function word.
- Majority of the preceding function words are
  - part of the verbal complex VC (45), e.g., preverbal negator, infinitival marker
  - the monosyllabic adverb *so* (12)

## Results

- In the VC: variation possible: in 82 out of 127 cases *ge-* does not attach to the previous material
- Negation particle and infinitival marker: close to obligatory, only 3 of 49 cases are not attached

## Corpus Study II: Old English

**Text used:** facsimile of the Anglo-Saxon Chronicles (Parker/Winchester chronicles) (Corp. Chris. MS 173, facsimile by Flower and Smith 1941)

- 'History' of England on 62 pages
- Written by a single scribe until 891 (then followed by others)
- Ends in 1070

### **Method:**

- Automatic search for *ge*-prefixed verbs and their preceding neighbors in transcription (modern word division, non-tagged)
- Manual search in the facsimile for orthographic varieties

## Results

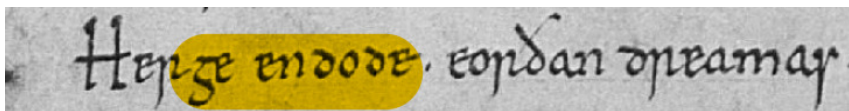

Four possible orthographic distributions of *ge-* in percent sorted by previous word category (lexical or function word)

Division	Total	Prec. function word	Prec. lexical word
<b>word <i>ge</i>-verb:</b>	55.8 %	33.4 %	64.6 %
<b>word-<i>ge</i> verb:</b>	10.4 %	87.5 % (37.5 % are 7)	12.5 %
<b>word-<i>ge</i>- verb:</b>	22.6 %	88.5 % (24.1 % are 7)	11.5 %
<b>word <i>ge</i> verb:</b>	11.2 %	41.8 %	55.8 %

- If *ge-* attaches to previous word, then preferably to a function word
- Majority of the preceding function words are
  - part of the verbal complex VC (46), e.g., auxiliaries
  - sentence-initial adverbs (29) like *here*, *there*, etc ...
- Rest are subject/object pronouns or stranded prepositions

## Results

- In the VC: variation possible: 17 out of 46 cases *ge-* does not attach to the previous material.
- Sentence-initial adverb: close to obligatory, only 2 of 29 cases are not attached.

*Her geendode eorðan dreamas*  
*'In this year Edgar, King of the Angles, died.'*

⇒ Cannot be explained via match, but typical Wackernagel position; often forming a trochaic foot

## Corpus Study III: Old High German

**Text used:** De nuptiis Philologiae et Mercurii *Liberus Primus* by Martianus Capella  
(Codex Sangallensis 872)

- Translation from Latin to German by Notker III. on 84 pages
- Written by two scribes
- Dated to the 11th century

**Method:**

- Manual search in the manuscript for orthographic varieties

## Results

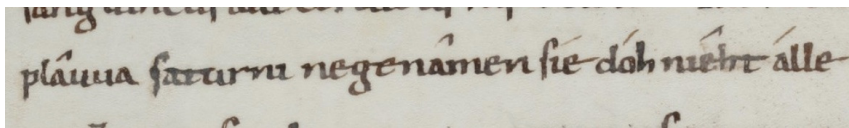

Four possible orthographic distributions of *ge-* in percent sorted by previous word category (lexical or function word)

<b>Division</b>	<b>Total</b>	<b>Prec. function word</b>	<b>Prec. lexical word</b>
<b>word <i>ge</i>-verb:</b>	92.6 %	38.4 %	60.4 %
<b>word-<i>ge</i> verb:</b>	0 %	0 %	0 %
<b>word-<i>ge</i>- verb:</b>	3.9 %	86 %	14 %
<b>word <i>ge</i> verb:</b>	3.3 %	50 %	50 %

- If *ge-* deviates from the expected pattern, then preferably with a preceding function word

## Results

- *ge-* never detaches from the verbal stem
- Attachment of previous words limited to two items:
  - preverbal negator *ne*
  - infinitival marker *zu*

*unde diu plauua saturni negenamen sie doh nieht alle*

*'And the blue Saturni did not take them all.'*

⇒ weak monosyllabic function words in a VC

This pattern is consistent (only two exceptions)

## Outlook

OHG uses accents to mark stressed syllables. They frequently extend over the *ge*-prefix  
→ prosodic cue?

## Overall Results

- **OE**: fairly free, but almost obligatory with sentence-initial adverbs
  - **OHG**: attachment to preceding material very restricted
  - **OS**: 'intermediate' between OE & OHG: Detachment from verb stem possible
    - Detachment from verbal stem possible; mostly with monosyllabic words
    - Most consistently in the environments found in OHG
- ⇒ An overall tendency in early West Germanic manuscripts of monosyllabic function words triggering different orthographic distribution of the *ge-* prefix
- ⇒ Most regularly across all three languages after *ne*

## The *ge-* prefix in Modern German

- occurs with several word categories
- with a verb: productively used to form the participle
- unstressed
- pronounced as a stop [g] (but regional differences)

## Production Experiment in Modern German

### Design

- negation particles
  - monosyllabic *nie* 'never'
  - disyllabic *nirgends* 'nowhere'
- auxiliary
  - monosyllabic *bin* 'be.1SG'
  - disyllabic *haben* 'have.1/3PL'
- object nouns with 1-3 syllables with different stress patterns preceded by a trochaic adjective

**Hypothesis:** If *ge-* is phased into a trochaic foot, it is more likely to do so

- a) with material within the same phonological phrase
- b) with material that ends in a degenerated trochaic foot (i.e., a stressed syllable)

## Production Experiment in Modern German

### Method

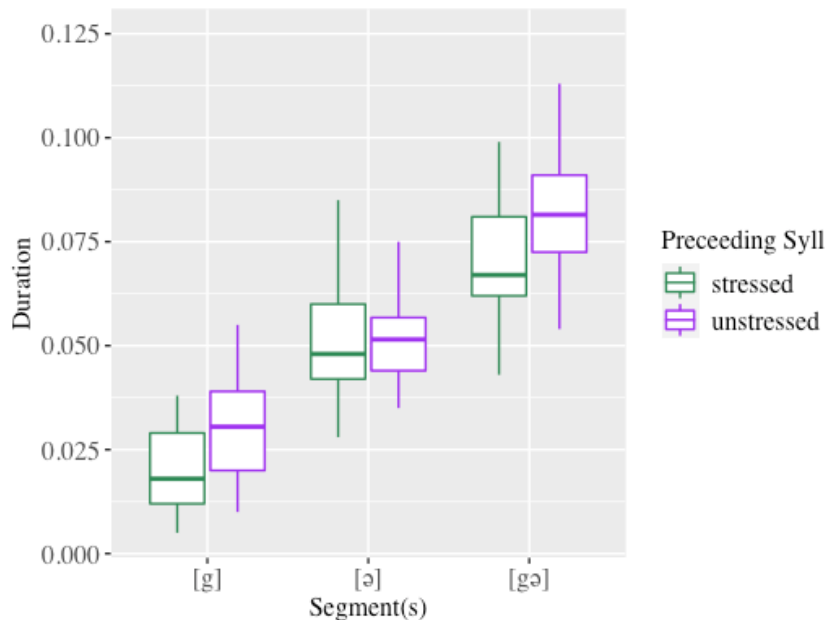

- 10 Native German speakers participated in the experiment (average age was 26.2, 4 males)
- 684 recordings  XX object nouns, XXX negation particles, XXX auxiliaries)

### Measurements

- closure duration of [g]
- duration of [ə]
- duration of [g]+[ə]

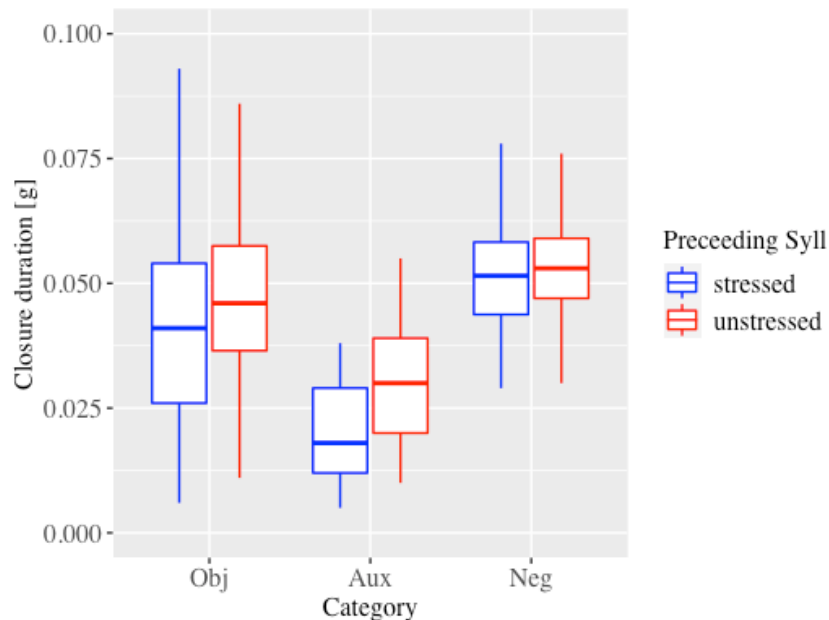

## Results

Duration of [g], [ə], and [gə] following auxiliaries

## Results

Closure duration of [g] following different types of word categories

## Discussion

- **Objects:** the prosodic phrase boundary after the object-NP seems to prevent the *ge*-prefix from incorporating prosodically with the previous material
- **Auxiliaries:** no larger prosodic boundary after the auxiliary; auxiliary and verb form a phonological phrase
  - monosyllabic: ((,bin *ge*) ('verb))  $\omega$
  - longer closure duration after disyllabic *haben*

⇒ supports historical data

- **Negation:** longest closure duration overall ⇒ contrasts historical data
  - *ne* is a clitic while *nicht/ nirgends* form separate prosodic words
  - focus accent suggests strong boundary after negation makers (Féry & Kügler 2008)

### ummary

- Diachronic & synchronic data indicate that the formation of a trochaic foot can occur across word boundaries → morphologically complete words can prosodically ‘split’
- The process most likely occurs within the domain of a prosodic phrase
