

Implementing Argument Alternations

Miriam Butt (Konstanz)
and
Tracy Holloway King (PARC)

ESLLI 2006, August, Malaga

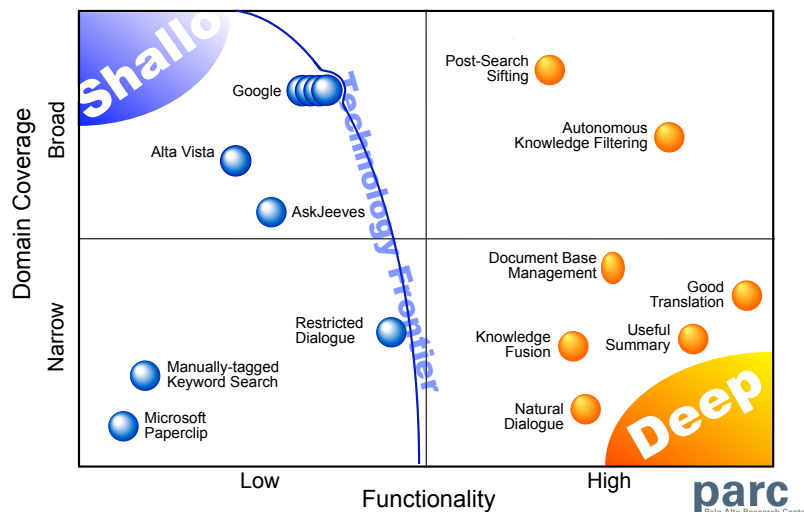

Overview

- Day 1:
 - Lexical Rules
(Passive, Dative Shift, Locative Alternation)
 - Intro to LFG/XLE
- Day 2: Argument Addition
(Benefactives, Applicatives)
- Day 3: V-V Complex Predicates (Urdu)
- Day 4: Causatives (Urdu, Romance)
- Day 5: Serial Verbs

Context: Language Engineering

Deep Grammar Engineering

- Draws on theoretical linguistics, software engineering
 - Theoretical linguistics => papers
Generalizations, universality, idealization (competence)
 - Software engineering => programs
Coverage, interface, QA, maintainability, efficiency, practicality
- Grammar engineering
 - Grammar::Theory = Program::Programming language
 - Reflect linguistic generalizations
 - Respect special cases of ordinary language
 - Deal with large-scale interactions
 - Theory/practice trade-offs

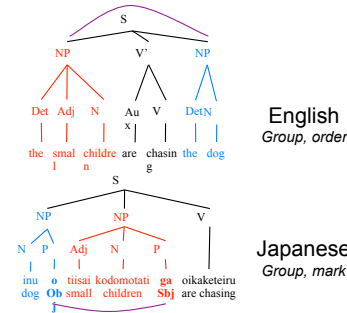

LFG/XLE

- LFG: a theory of grammar
- XLE: a parsing/generation engine for LFG grammars

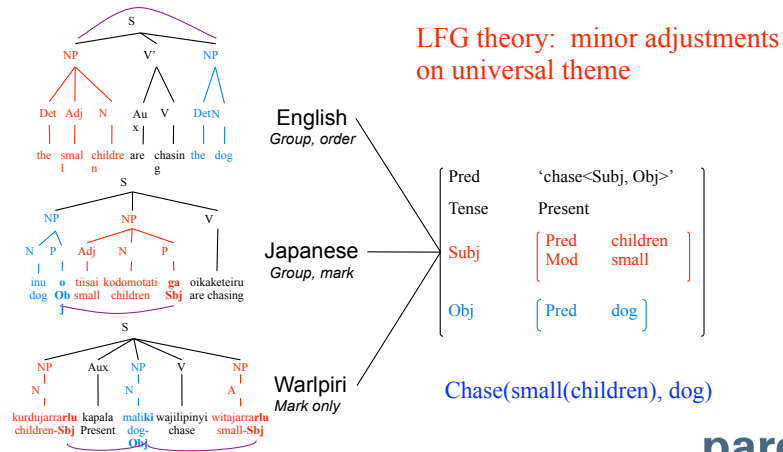

Different patterns code same meaning

The small children are chasing the dog.

Different patterns code same meaning

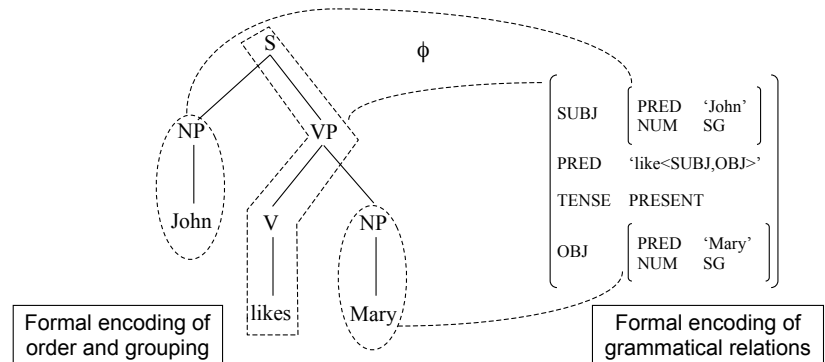

The small children are chasing the dog.

LFG architecture

Modularity

C-structures and f-structures in piecewise correspondence.

LFG grammar

Rules

S → NP VP
 (↑ SUBJ)=↓ ↑=↓

VP → V NP
 ↑=↓ (↑ OBJ)=↓

Lexical entries

John: NP (↑ PRED)='John'
 (↑ NUM)=SG

likes: V (↑ PRED)='like<SUBJ, OBJ>'
 (↑ SUBJ NUM)=SG
 (↑ SUBJ PERS)=3

- Context-free rules define valid c-structures (trees).
- Annotations are instantiated at tree nodes to give equational constraints that corresponding f-structures must satisfy.
- Satisfiability of constraints determines grammaticality.
- F-structure is solution for equations (if satisfied).

Rules as well-formedness conditions

A tree containing S over NP - VP is OK if
 F-unit corresponding to NP node is SUBJ of f-unit corresponding to S node
 The same f-unit corresponds to both S and VP nodes.

Inconsistent equations = Ungrammatical

What's wrong with *They walk^s* ?

Let **f** be the f-structure of the sentence
s be the f-structure of the Subject
v be the f-structure of the verb

Then (substituting equals for equals):
 (f SUBJ) = s and (s NUM)=PL
 => (f SUBJ NUM)=PL
 f = v and (v SUBJ NUM)=SG
 => (f SUBJ NUM)=SG

If a valid inference chain yields FALSE, the premises are unsatisfiable.
 (f SUBJ NUM)=PL and (f SUBJ NUM)=SG
 => **SG=PL => FALSE**

Pargram project

- Large-scale LFG grammars for several languages
 - English, German, Japanese (Korean), French, Norwegian, Chinese, Turkish, Arabic, Hungarian
 - Cover real uses of language--newspapers, documents, etc.
- Parallelism: test LFG universality claims
 - Common c- to f-structure mapping conventions (unless typologically motivated variation)
 - Invariant underlying f-structures
 - Permits shared disambiguation properties, Glue interpretation premises
 - All grammars run on PARC software (XLE)
- International consortium of linguists
 - PARC, Stuttgart, Fuji Xerox, Konstanz, Bergen, Sabanci, Oxford, Oman
 - Sustained effort--full-week meetings twice a year...~10 years!
 - Contributions to linguistics and computational linguistics: books and papers
 - Each group is self-funded, self-managed

History

- Started in 1994
 - English (PARC)
 - French (XRCE, now PARC)
 - German (IMS-Stuttgart)
- Biannual meetings
 - Alternating between Palo Alto and Europe/Japan
- 1998: Japanese started (Fuji Xerox)
- 1999: Norwegian started (University of Bergen)
- 2000: Urdu (Konstanz)
- 2002: Danish started (Copenhagen)
- 2003: Korean (PARC) porting experiment
- 2004: Welsh, Malagasy (Essex, Oxford)
Chinese (PARC)
- 2005: Arabic (Oman), Turkish (Sabanci), Hungarian

Goals

- Practical**
 - Create a capability/platform for NL applications
 - translation, information retrieval, ...
 - Develop discipline of grammar engineering
 - what tools, techniques, conventions make it easy to develop and maintain broad-coverage grammars?
 - how long does it take?
 - how much does it cost?
- Theoretical**
 - Refine and guide LFG theory through broad coverage of multiple languages
 - Refine and guide the algorithms and implementation (XLE)

Parallel f-structures (where possible)

"Es schlafen zwei Mädchen aus Paris."

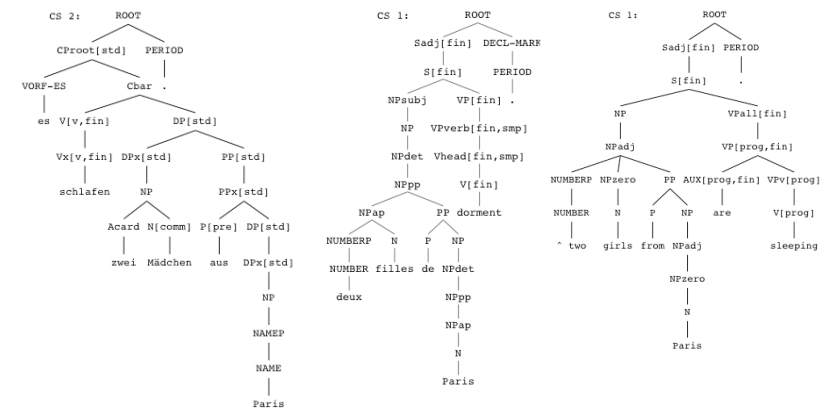

"Deux filles de Paris dorment."

"Two girls from Paris are sleeping."

...but different c-structures

Pargram grammars

	#Rules	#States	#Disjuncts
German	251	3,239	13,294
English*	388	13,655	55,725
French	180	1,747	12,188
Japanese (Korean)	56	368	2,012

* English allows for shallow markup: labeled bracketing, named-entities

Engineering results

- Grammars and Lexicons
- Parallel f-structures across languages
- Grammar writer's cookbook
- New practical formal devices
 - Complex categories for efficiency NP[nom] vs. NP: (↑ CASE) = NOM
 - Optimality marks for robustness
 - enlarge grammar without being overrun by peculiar analyses
 - Lexical priority: merging different lexicons

Argument Alternations

- Some Argument Alternations are quite well understood (e.g., passive)
- Others, like complex predicates, causatives or serial verbs are still the subject of intensive linguistic investigation.
- This means that grammar engineering also faces quite a few challenges.

Passive and the Lexicon

Wide Spread View:

A dumping ground for exceptions:

“A kind of appendix to the grammar, whose function is to list what is unpredictable and irregular about the words of a language” (Kiparsky)

Passive and the Lexicon

Bresnan's (LFG's) view:

A repository of linguistic generalizations —

Rules relating lexical items are a prime locus of syntactic generalizations

Passive and the Lexicon

Transformational View of Passives:

Active is basic: *The farmer has killed the duckling.*

Passive is derived:

The duckling has been killed by the farmer.

If *S1* is a grammatical sentence of the form
NP1 - Aux - V - NP2,
then the corresponding string of the form
NP2 - Aux + be + en - V - by + NP1
is also a grammatical sentence.

Passive and the Lexicon

Problems:

Very language specific

magister pueros laudat
teacher.Nom boy.Acc.Pl praise.3Sg
'The teacher praises the boys.'

Not all verbs passivize:

The duckling has been fallen by the farmer.

Clearly what verbs passivize (and how) is tied to **lexical** information.

Passive and the Lexicon

Next Try:

The nominal that is in the accusative case in an active clause is in the nominative in the 'corresponding' passive clause. (Perlmutter and Postal 1983:7)

magister pueros laudat
teacher.Nom boy.**Acc.**Pl praise.3Sg
'The teacher praises the boys.'

pueri a magistro laudantur
boy.**Nom.**Pl by teacher.Abl praise.Pass.3.Pl
'The boys are praised by the teacher.'

Passive and the Lexicon

Still not good enough crosslinguistically:

West Greenlandic:

gimmi-p miiraq kii-va-a
dog-Erg child.Abs bite-3Sg-3Sg
'The dog bit the child.'

miiraq gimmi-mik kii-tsip-puq
child.Abs dog-Instr bite-Pass-3Sg
'A child has been bitten by the/a dog.'

Passive and the Lexicon

Consensus in Relational Grammar, Role and Reference Grammar and LFG:

Passive Rule must

a) be stated in terms of Grammatical Functions (these look different in different theories)

b) associated with individual lexical items.

Sample LFG Version:

([^] SUBJ) ⇒ ([^] OBL-AG)

([^] OBJ) ⇒ ([^] SUBJ)

Passive and the Lexicon

Grammatical Functions in LFG:

SUBJ, OBJ, OBJ-?, OBL-?, ADJUNCT, COMP, XCOMP

Practical Implementation
